# tricorn

Production control software

Simple production control for smart manufacturing

Tricorn is an intuitive Production Control System that manages operations from Quotation to Invoice, enabling you to easily meet quality, cost, efficiency, and delivery targets.

Integrated modules mean Tricorn is suited to Sub-Contract, KOP, Kan-Ban, Make-to-Stock, and Make-to-Order manufacturing, including assemblies.

With the reporting and analysis capabilities, Tricorn enables you to continually evaluate performance and improve efficiency of the total manufacturing process, through variance analysis and improved control of lead times, inventory and work-in-progress.
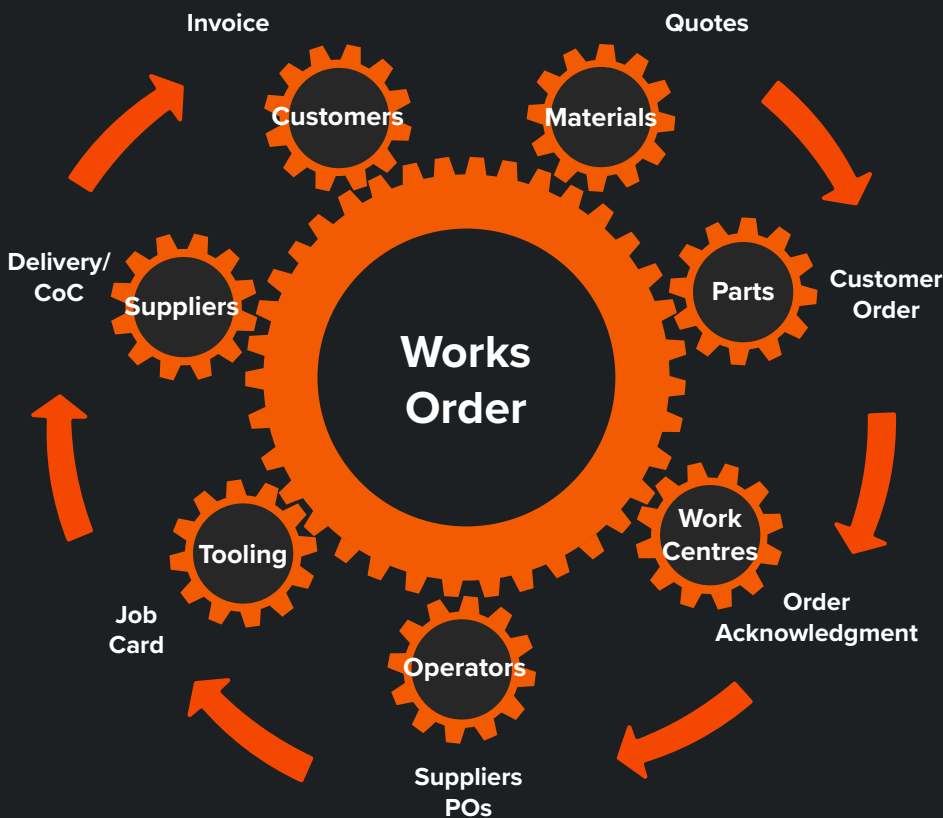

Rapid deployment: go live in days, no weeks or months

"Tricorn enabled us to increase our turnover by 50%"

"Tricorn has made us quicker and more efficient and I am really impressed with the traceability of all the data. It has helped us to grow - we could never have increased our turnover by 50% since the system was installed without the help of Tricorn. I should have done it sooner!"

- Loftlock Precision Engineering Ltd

Features

Estimating & quoting

Job costing estimates can be prepared in detail by including materials, parts and sub-components. By providing mark-up percentages for each stage of the build process, you can accurately view how much to quote.

Quotes can cover single items, multiple items or quantities, assemblies or kits of parts in any combination.

Stock control

Tricorn enables you to record the raw materials and components used, together with costs, specifications, locations, quantities in stock and quarantined.

'Stock lists' with valuations can be printed showing the amount of parts in stock and all associated information (works orders, traceability, etc.)

Production

Works orders can be created from successful quotes, previous works orders or parts templates. Job cards with key information can be printed to your specification. Manage multiple delivery batches and stock.

Time recording can be achieved via barcode scanners, touch screens or direct input.

Purchase orders

POs can be raised for works orders or stock for purchases. Goods inwards can record deliveries against purchase orders with full material traceability.

Certificates of conformity documents can be attached as links to materials booked in or sub-contract items returned after treatment.

Invoicing

Seamlessly produce invoices from delivered batches without needing to re-enter information.

Invoices can be created individually or in mass, saving time and to aid payment receipt, they can be sent directly to customers from within the system.

Request for quotation

RFQs can be raised to send to multiple suppliers for materials, parts and subcontract activities.

Responses can be recorded for future use and a purchase order can then be raised directly from the selected RFQ response.

Security & access control

Tricorn requires each user to have a userID and password to access the system.

Viewing and document creation/ammendment rights are also held in the user database and can only be changed by the administrator of the system.
